

○ Executive Summary:

This project analyzes customer transactions and behavior using RFM analysis and K-means clustering techniques. The dataset was cleaned and processed to identify customer segments, purchase patterns, and churn risks. Various visualizations such as sales trends, pie charts, customer segmentation graphs, and churn analysis were created to understand customer behavior.

The analysis identified loyal customers, high-value customers, and churn-risk customers. Product category analysis also helped identify top-performing categories contributing to sales and profit.

Based on the findings, recommendations were provided for Alfido Tech, including loyalty reward programs, personalized marketing, and customer retention strategies.

This project demonstrates how Data Analytics can help businesses improve customer engagement and decision-making.
